# Aquarius Spectrum has launched a new analysis engine

Aquarius Spectrum launched a new analysis engine which adds great value to our customers through improved analysis process and additional significant insights such as:

➢ Ability to detect multiple Leaks between 2 sensors. This strong feature will overcome the noise of pumps and other sources of noise that normally mask leak noises.

➢ Improved UI that presents more valuable data in the alerts tab which reduces the need to navigate to other windows.

➢ A new indication for fast growing or fast declining leaks.

➢ New and dynamic graphs with zoom-in capabilities. The graphs include data hints information and are automatically connected to the selected 'units' methodology.

➢ Improved Audio panel which includes the ability to listen and download the sampled audio.
